A close-up photograph of a large pile of straw bedding. The straw is light brown and appears to be made of long, cylindrical pieces of dried grass, some of which are broken into smaller fragments. The texture is fibrous and porous.

**SIMPLE
EASY BEDDING**

Chapelstone

THIRSTY BED

Triple dust extracted

Super Absorbent

Easy and fast composting

100% made from untreated wood

VERY low moisture content

Cost Effective

Less waste than conventional bedding

Can assist in reducing allergy and respiratory symptoms

Better for your horses

Chapelstone **Thirsty Bed** horse bedding is made from environmentally friendly wood fibres which undergo the latest moisture and dust extraction process prior to being made into a pellet. The pellets, when activated with water, expand to form a dry, comfortable, soft bed for your horse.

Due to **Thirsty Bed's** superior absorbency, urine is totally absorbed and held in a small area, stopping moisture from spreading over the rest of the stable bedding; thus helping your horse to stay as dry and comfortable as possible.

Thirsty Bed is TRIPLE dust extracted and the pinewood content has antiseptic qualities. Odour control is excellent and ammonia fumes are greatly reduced. The pellet making process also burns off any natural spores and resins within the wood fibres; both of these factors can have a beneficial effect for horses with respiratory problems.

When **Thirsty Bed** is used in a trailer or lorry you can relax in the knowledge your floor is staying as dry as possible and your horse is comfortable too.

Better for your purse

Thirsty Bed is so easy to use - it will greatly reduce the amount of time spent mucking out.

Waste removal costs are minimised and as less bedding is removed each day **Thirsty Bed** is extremely economical.

Thirsty Bed comes in manageable 15kg bags which are easy to store particularly when ordered by the pallet as we supply a waterproof clear plastic pallet cover giving you the option of outdoor storage.

The outstanding absorbency of **Thirsty Bed** means that urine contact with matting is minimal, reducing the frequency of having to lift the mats for cleaning.

Better for the environment

Thirsty Bed wood fibres are sourced from sustainable forests within the UK, therefore its carbon footprint is much smaller than that of other brands!

Bedding waste is completely biodegradable and can be used for composting as the wood fibre breaks down easily.

The moisture extraction and pellet making process means that all resins are removed, speeding up the composting process.

Thirsty Bed Fork

A Fine-Tines™ fork is designed for wood pellet type bedding such as **Thirsty Bed** and its unique basket minimises on wastage of good bedding making it easy and stress free to muck out your stables.
